

COMPRESSION THAT STAYS UP FOR ELEVATED COMFORT

JOBST

DEFY GRAVITY

Advanced lymphedema treatment
with revolutionary SoftFit™ technology.

A GRIPPING IDEA

JOBST's innovative SoftFit technology is a unique system of silicone yarns knitted into the welt of our compression garments. It provides gentle, seamless friction on the skin, allowing for decreased chance for constriction and less slipping down.

Looks good, feels good

With SoftFit technology, garments are not only visually appealing and more comfortable to wear, but they provide precisely the right amount of pressure, right where it is needed.

Improved compliance, improved quality of life

Compression garments that feel comfortable lead to greater patient compliance.

You'll hear less complaints about bulkiness and discomfort because SoftFit technology is smoother and more comfortable to wear.

More choice, happier patients

With SoftFit technology, there is a wider variety of compression garments to choose from when treating your patients and their lymphedema.

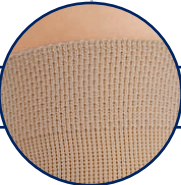

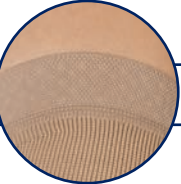

THE RIGHT COMPRESSION GARMENT EVERY TIME

SoftFit technology complements our knitted welt and silicone band compression garments and works across all stages of lymphedema treatment.

Given the number of influencing factors and criteria to consider, both doctor and patient should jointly decide on the best choice of stocking depending on the patient's physiological and psychological situation at the time.

STAGE 0	STAGE 1	STAGE 2	STAGE 3
Latent: A subclinical state where swelling is not evident despite impaired lymph transport. This stage may exist for months or years before oedema becomes evident.	Mild: This represents early onset of the condition where there is accumulation of tissue fluid that subsides with limb elevation. The oedema may be pitting at this stage.	Moderate: Limb elevation alone rarely reduces swelling and pitting is manifest. There may or may not be pitting as tissue fibrosis is more evident.	Severe: The tissue is hard (fibrotic) and pitting is absent. Skin changes such as thickening, hyper-pigmentation, increased skin folds, fat deposits and warty overgrowths develop.

IMPROVED SOLUTIONS, ENHANCED THERAPY

SoftFit technology is a new and unique benchmark standard in the treatment of lymphedema.

As the market leaders, JOBST® has always been committed to finding the best possible solutions to increase therapy compliance and achieve greater patient acceptance.

The high friction SoftFit silicone yarn we've knitted into the welt at the top of our garments, cuts out the tight grip

other compression wear needs to stay up. This allows them to stay in place when moving about and encourages greater compliance, as well as being much more comfortable to wear. This in turn leads to a far better quality of life for patients who can concentrate on their daily life with less restrictions.

For health care professionals, this high level of therapy compliance and patient acceptance helps make lymphedema management significantly more successful.

WHEN IN USE THEY WORK REALLY WELL

BETTER FOR PATIENTS:

- More visually appealing, more stylish
- Patients complain less about discomfort and sliding down when moving about
- They can focus on their daily lifestyle with less restrictions

► This leads to increased quality of life

BETTER FOR PROFESSIONALS:

- Higher patient commitment to therapy
- More effective treatment due to more consistent patient wear

► This supports greater treatment success

BETTER FOR DEALERS / RETAILERS:

- Supports more effective treatment outcomes
- Greater patient acceptance and preference

► This leads to greater loyalty and increasing repeat sales

Extra patient compliance comes with every garment
